ON: 13/06/2007

EXPLANATORY NOTES

GENERAL

This report is designed to substantiate and quantify claims for extension of time brought about by weather which prevents various types of work on site from proceeding. All times quoted are GMT
Actual hour by hour readings for each day are given as tabulations and graphs at the back of the report.
The earlier pages provides an hourly analysis of particular working limits for:

- (i) 10 minute mean wind speed for each hour (yellow header)
- (ii) maximum wind gust for each hour (red header)
- (iii) air temperature for each hour (pink header)
- (iv) humidity, sunshine and precipitation (blue header)

ACTUALS

For each element, for each limit, actual data is given for each working day. Values for the month as a whole are given at the base of the report and compared to an average based upon the same month in previous years. This gives a 'deviation from average' or 'anomaly'.

ANOMALIES

The Average Daily Anomaly describes how much more (+ve) or less (-ve) of each weather element was experienced for each day 'this year' compared to normal. The Total Anomaly is the product of the daily anomaly and the number of working days, and indicates net surplus (+ve anomalies) or deficit (-ve anomalies) in (inclement) weather. For critical limits, high positive total anomalies give an idea of how many hours might legitimately be claimed for as extension of time.

PERCENTILES

The final row, Degree of Extremity (Percentile) ranks this years weather with that of previous years. The value gives an idea of what proportion of previous years experienced conditions 'worse' than that of the current year. A value of 10% implies that this years weather was very inclement, and that 'worse' conditions occurred in only 1 in 10 of previous years. 0% indicates that this years value was unprecedented and the weather the worst 'ever'.
